

NOAA Science Update to the Science Advisory Board

Sarah Kapnick, Ph.D.
NOAA Chief Scientist

July 26, 2023

CDR Strategy Released

The Strategy for NOAA Carbon Dioxide Removal (CDR) Research was published in June 2023

- Let's kick off this discussion with one recent white paper that was released last month.
- NOAA's new Carbon Dioxide Removal Research Strategy is another way that NOAA is working with Congress and our partners to build a Climate Ready Nation.
- In this context, the CDR industry is growing rapidly, and could be as much as a \$1 Trillion market by 2050, according to McKinsey.
- However, many CDR methods are currently in their infancy. This is especially true of CDR methods that impact the oceans
 - Overall, current CDR capacity falls about 80 percent short of the requirement suggested by IPCC.
 - Future deployment of technologies that are found to be efficient, effective, and acceptable will still take considerable time to scale up.
 - In the broader landscape of CDR research, NOAA has the right expertise to assess the efficiency, effectiveness, and environmental impact of marine and terrestrial CDR techniques proposed by non-NOAA entities.
 - This is likely to require a portfolio of NOAA science, including carbon observations, environmental monitoring, modeling, technology development, and decision support.

- In particular, we want to ensure that any carbon dioxide removal techniques that are implemented as part of the growing Blue Economy have a well known risk-benefit profile.
 - NOAA's science and stewardship missions can help evaluate CDR strategies and implementations to ensure that they are safe, sustainable, and fair.
- We believe the time is now to start this research.
 - The next decade is a critical time to address the climate crisis.
 - We have a small window to shift to a carbon-neutral economy and hold climate impacts in check.
 - We must enact transformational change at the national level, but we must also harness the power of ambition and the call for action at every level to solve this challenge together.
 - NOAA's portfolio of climate intervention research can help us do that.

Strategic Research Guidance Memorandum Released

National Oceanic and Atmospheric Administration
Strategic Research Guidance Memorandum
FY2025

There are several key research and development themes emerging across NOAA, requiring budget consideration for their success. These high-level themes are summarized below in section order. Details of FY25 research priorities mapped onto the NOAA 2022-2026 Strategic Plan are provided in this document's full.

Data acquisition, open data, big data	<ul style="list-style-type: none">Continued support of new aircraft and instrumentation, especially in light of upcoming aircraft retirement schedulesContinued data acquisition to monitor and predict the Earth system including space weatherEnsure data stewardship including record continuity, accuracy, consistency, and accessibilityExpand research to make use of big data, especially artificial intelligence and machine learningContinued expansion of open science capabilities and data delivery to support commerceExpand deep ocean instrumentation capabilitiesContinued investment and support for high performance computing
Data assimilation and reanalysis	<ul style="list-style-type: none">Build sustained operational reanalysis capabilitiesContinued support of data assimilation advancementsLeverage in forecasts, response-to-disaster predictions, and product deliverySupport sustained, long-term satellite records and their incorporation into data assimilation, reanalysis, and models
Earth system modeling across timescales	<ul style="list-style-type: none">Advance skill and resolutionExpand outputs and information across timescales for decision makersSupport transitions from research to operational outlooks and products
Social, Behavioral, Economic Sciences (SBEES)	<ul style="list-style-type: none">Increase use of SBEES along with product and service design and developmentMeasure societal impacts of NOAA's products and servicesConduct authoritative science to support new fields of nature capital and prediction applicationsSupport economic forecasting and cross-timescale economic impact assessment reliant on NOAA data
Workforce and partnerships	<ul style="list-style-type: none">Advance workforce development at NOAA and with our partnersLeverage strategic partnerships to deliver research and development goalsSupport co-design and co-development of applications to fully exploit datasets (terrestrial and other)
Accessibility and equity	<ul style="list-style-type: none">Build a workforce that reflects the diversity of our NationReview and expand accessibility and equity of our data, products, and services

May 2023

The FY25 Strategic Research Guidance Memorandum (SRGM) was published in May 2023.

The FY26 SRGM is in development.

- The FY25 Strategic Research Guidance Memorandum, which provides the portfolio logic of NOAA's R&D enterprise, was finalized in May 2023
- The overarching topics for this FY25 SRGM are:
 - Data acquisition, open data, big data
 - Data assimilation and reanalysis
 - Earth system modeling across timescales
 - Social, Behavioral, Economic Sciences
 - Workforce and partnerships
 - Accessibility and equity
- The FY26 is under development and we will have a more in depth discussion about this.
- <https://sciencecouncil.noaa.gov/council-products/strategic-research-guidance-memorandum/>

The NOAA R&D Vision Areas provides direction on NOAA's R&D and enables proactive actions to align NOAA's resources, budget, and functional activities to achieve stated goals.

- This briefing has been organized under these three vision areas

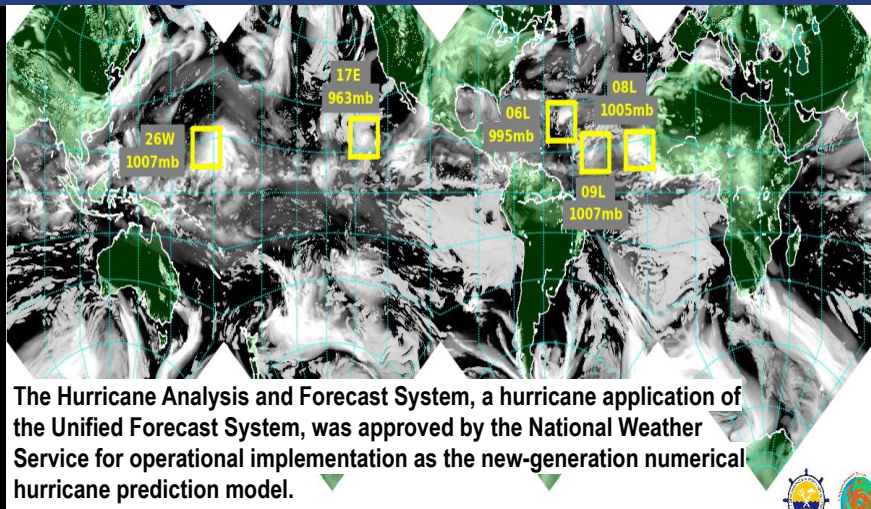

Vision Area 1: Reducing societal impacts from hazardous weather and other environmental phenomena

Hurricane Analysis and Forecast System goes Operational

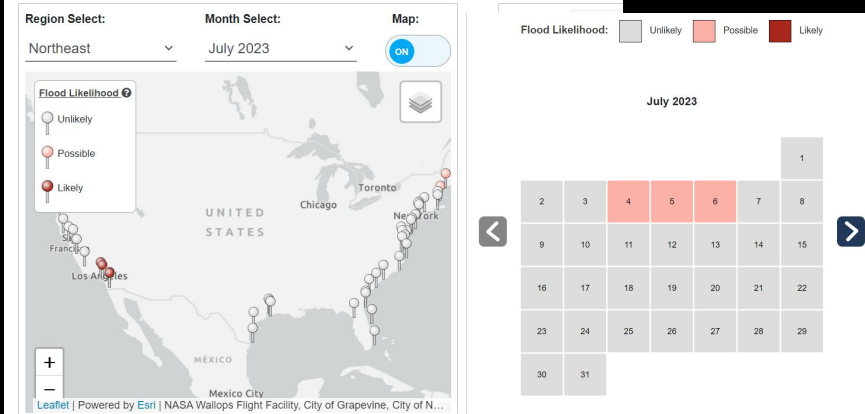

Representation of what the model will be at full maturity.

- NWS
- The Hurricane Analysis and Forecast System (HAFS) model was jointly developed by AOML, NCEP's Environmental Modeling Center of NWS, and their partners becomes operational.
 - Key to this success was the development of a Research to Operations Transition Plan that provided a roadmap for the process and facilitated communication between AOML (R&D) and NWS (operations).
- This was a true collaborative effort with vital contributions from senior modelers to a student scientist who supported AOML through the NOAA Experiential Research and Training Opportunities (NERTO) program.
- The overarching goal is to improve forecasts and provide more accurate numerical guidance to forecasters and stakeholders so as to reduce loss of life and property damage.
- Operationalized in 2023, the HAFS, part of the [Unified Forecast System](#), provides improved forecasting of storm track, intensity (hurricane winds), and structure by allowing scientists to “zoom in” and follow a close-up view of the storm.
- With this upgraded storm view, scientists can look for clues that may indicate conditions ripe for rapid intensification—tropical cyclone winds increasing by at least 35 mph in a 24 hour period—and other unique features of the storm.

- Was this a community effort within UFS or was this only AOML/EMC?
 - all of the players but mostly AOML/EMC/CIMAS/GFDL
- What is causing the improvements in this model?
 - HAFS comprises five major components: (a) High-resolution moving nest (b) High-resolution physics (c) Multi-scale data assimilation (DA) (d) 3D ocean coupling, and (e) Observations to support the DA.
 - enabled multiple sets of moving telescopic nests to follow more than one tropical cyclone at a time.
 - having storm-following nests around all active tropical cyclones at the same time produced more accurate forecasts
 - Intensity forecasts improved as more tropical cyclones and, consequently, more moving nests were added to the model, with gains of up to 30%
- Recent interview:
 - <https://research.noaa.gov/2023/05/24/noaas-new-hurricane-forecast-model-a-conversation-with-the-lead-modeler/>

New Monthly High Tide Flooding Prediction Model

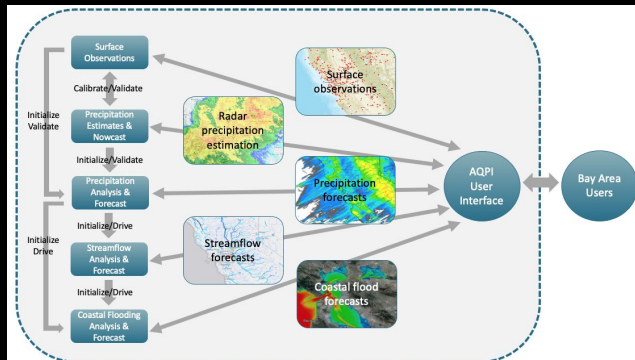

Monthly High Tide Flooding Outlook

On June 1st, 2023, NOAA replaced the Seasonal High Tide Bulletin with the new Monthly High Tide Flooding Outlook.

- NOS
- On June 1st, 2023, NOAA replaced the Seasonal High Tide Bulletin with the new Monthly High Tide Flooding Outlook.
- CO-OPS, with partners from University of Hawaii and NESDIS NCEI, published new research which demonstrates skillful monthly prediction of daily High Tide Flooding likelihood up to a year in advance.
- CO-OPS then worked to implement this R&D into CO-OPS operations, as a new monthly High Tide Flooding Outlook, within about 7 months time.
- The outlook is updated monthly and provides coastal communities with likely coastal flood days for the next year at NOAA tide gauges.
- It is important to note that this product is a “user-driven product development process”. The team has been working to gather user feedback since their soft launch on June 1st and feedback will be incorporated into future versions.
- A full media rollout of the outlook is likely to occur on August 22

Advanced Quantitative Precipitation Information (AQPI)

- On the West Coast, NOAA is developing a network of advanced weather radars and new surface meteorology stations that will feed into numerous meteorological and hydrologic models throughout NOAA and USGS.
- This project, called Advanced Quantitative Precipitation Information (AQPI) will help to improve precipitation and temperature forecasts, and during this last winter season, led to better rainfall estimates and overall situational awareness for the atmospheric river events that affected the San Francisco area.

- OAR
- In the western US, NOAA continues to research and develop ways to prepare for and respond to extreme drought and precipitation events.
- On the West Coast, NOAA is developing a network of advanced weather radars and new surface meteorology stations that will feed into numerous meteorological and hydrologic models throughout NOAA and USGS.
- This project, called Advanced Quantitative Precipitation Information (AQPI) will help to improve precipitation and temperature forecasts, and so far this year, has led to better predictions of two big atmospheric river events that affected the San Francisco Area.
- NOAA is also in the process of developing multiseasonal atmospheric river frequency forecasts, which will allow for longer-term preparation for water resources.

Vision Area 2: Sustainable use and stewardship of ocean and coastal resources

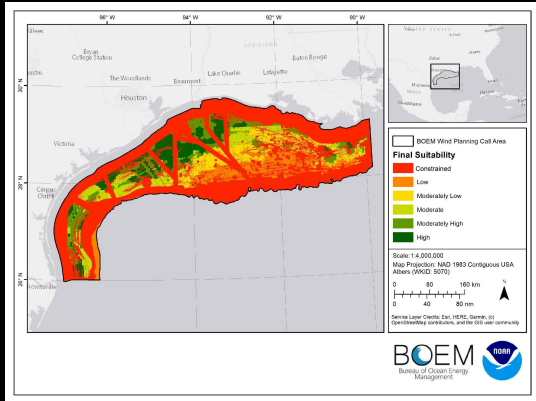

South entrance of Detroit River to the right and northeast corner of Lake Erie to the left. Photo credit: NOAA/OAR/GLERL

- ecological forecast that provides early warning of toxin blooms and minimizes the need for widespread harvest closures.

- The White House PFAS ([Per- and Polyfluoroalkyl Substances](#)) Report was released in March 2023

Offshore Wind Team Provides Spatial Planning Models

- The offshore wind team is developing comprehensive spatial models to help characterize ocean environments and industries to more holistically and efficiently inform BOEM's decision-making on offshore wind siting.
- The team has completed models for the Gulf of Mexico and Central Atlantic with models for Oregon and the Gulf of Maine in development.

- NOS
- In support of NOAA's renewable energy efforts, NOAA partnered with BOEM ([Bureau of Ocean Energy Management](#)) to help identify the most suitable locations for offshore wind energy siting.
- The offshore wind team is developing comprehensive spatial models to help characterize ocean environments and industries to more holistically and efficiently inform BOEM's decision-making on offshore wind siting.
- The team has completed models for the Gulf of Mexico and Central Atlantic with models for Oregon and the Gulf of Maine in development.
- In addition, the team is developing cable routing models to help inform energy transmission.

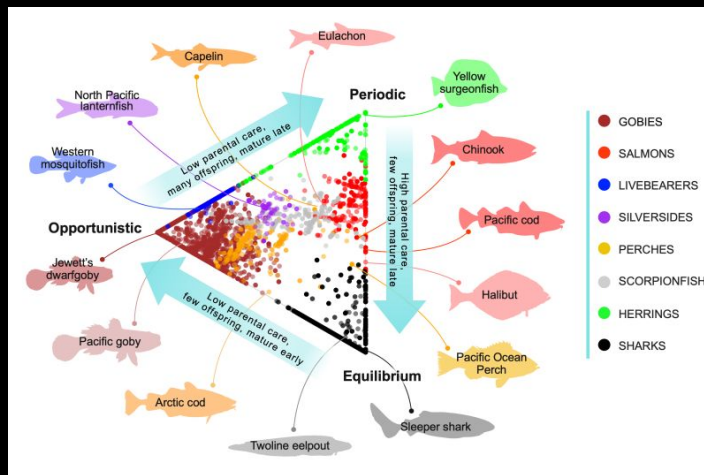

Vision Area 3: A robust and effective research, development, and transition enterprise

Scientists Can Predict Traits for All Fish Worldwide for the First Time

- Scientists have developed a new model that can now predict growth, survival, and reproductive strategies for all known fish in the world.
- The results will inform ecosystem-based fisheries management, help forecast consequences of climate change, and advance our understanding of evolutionary relationships.

- NMFS - Fisheries
- Scientists have developed a new model that can now predict growth, survival, and reproductive strategies for all known fish in the world.
- The [new model](#) uses 33 traits—describing size, growth, reproduction, parental care, lifespan and more— to classify more than 34,000 fish species among three dominant strategy types.
- The model uses the Robin-Hood approach (borrow from data-rich species to predict strategies for data-poor species) and also uses evolutionary information to inform which species are closely related.
- We can only assess a fraction of the fish species that are caught around the world. This model can predict traits and strategies for all the rest.
- The results will inform ecosystem-based fisheries management, help forecast consequences of climate change, and advance our understanding of evolutionary relationships.

Integration of Aerial and Underwater UxS Data into the Cloud

Graphic showing the integration of different data streams from airborne and water surface drones to map shallow water (<10 m) depths. Credit: NOAA.

- We made significant progress towards integrating these goals by developing and procuring uncrewed aerial and underwater vehicles with novel payloads;
 - by storing and processing data from these vehicles in Microsoft's Azure cloud environment;
 - by applying commercially available AI to translate data from these systems into information.

- NOS
- NOAA has committed to using cloud services, uncrewed systems and artificial intelligence (AI) to provide accurate and timely scientific information to advance the new blue economy and build a climate ready nation.
- In 2023, the National Centers for Coastal Ocean Science (NCCOS) made significant progress towards integrating these goals by developing and procuring uncrewed aerial and underwater vehicles with novel payloads; by storing and processing data from these vehicles in Microsoft's Azure cloud environment; and by applying commercially available AI to translate data from these systems into information.
- While there is still work to be done, these advances have increased NOAA's technical capacity to respond to the growing list of challenges facing U.S. oceans and coastal communities.

High-altitude Research Tool Passes Key Milestone

The HORUS glider and balloon prepared for a test flight on May 17, 2023 in Colorado's Pawnee National Grasslands. (Credit: NOAA)

The Global Monitoring Laboratory deployed high-value, balloon-borne greenhouse gas and meteorological instruments onboard a glider to 90,000 feet and returned them to the launch point, an achievement that greatly expands NOAA's ability to observe the upper atmosphere in both remote and climate-critical regions.

Balloon-borne instruments are traditionally considered expendable or need to be recovered manually.

- OAR
- NOAA's Global Monitoring Laboratory (GML), with collaborators from NOAA's Office of Research Transition and Application (ORTA) and Office of Marine and Aviation Operations (OMAO), developed a reliable, cost-effective way to retrieve balloon-borne instruments from the stratosphere.
- On May 17, 2023 over the eastern Colorado plains, GML used a balloon to lift the glider with a scientific sensor package—the GML-designed AirCore sampling system—to an altitude of 90,000 feet (where the atmosphere is only 2% as dense as at the surface) in controlled airspace and return it to the original launch location.
- The balloon lifts a remote-controlled glider with an instrument package installed in its belly to altitudes up to 90,000 feet.
- The glider is programmed to release from the balloon at a specific altitude and then navigate back to a loiter point above the landing spot, where it circles until the launch crew takes over controls and lands it.
- This milestone is a major achievement for weather and climate research, which has long depended on balloon-borne measurements but has been limited by the fact that balloons drift with the wind, carrying instrumentation as far as 100 miles from the launch point.

Thank you!

NOAA Science Update to the SAB
